

6.5.2. Constant, Uniform External Electric Field $\vec{E}$: The Stark Effect

The Hamiltonian on page - - reduces to

$$H = H_0 + H_{fs} + e \vec{E} \cdot \vec{R}.$$

Choosing $\vec{E}$ to lie along the z -axis

$\vec{E} = E \hat{z}$, the Hamiltonian becomes

$$H = H_0 + H_{fs} + eEz.$$

For simplicity we will consider $\vec{E}$ to be very much larger than H_{fs}

$$\text{i.e. } |eEa_0| \gg mc^2 \alpha^4$$

and consequently ignore H_{fs} to lowest order. Thus we have the Hamiltonian

$$H = H_0 + \underbrace{eEz}_{=H'}$$

with the effects of $H' \ll$ those of H_0 ($|eEa_0| \ll mc^2 \alpha^2$)

According to R-S degenerate perturbation we must diagonalize the unperturbed matrix elements of H' to find the first order energy level shifts,

$$E_{nl}(m) = E_n^0 + \Delta E_{nl}(m)$$

with the shifts $\Delta E_{nl}(m)$ the eigenvalues of

$$\langle n, l', m' | H' | n, l, m \rangle$$

$$= eE \langle n, l', m' | Z | n, l, m \rangle$$

$$= eE \int d^3r \psi_{n, l', m'}^*(\vec{r}) Z \psi_{n, l, m}(\vec{r}) .$$

Now letting $\vec{r}' = -\vec{r}$ and recalling that

$$\psi_{n, l, m}(\vec{r}) = R_{nl}(r) Y_l^m(\pi - \theta, \varphi + \pi)$$

$$= R_{nl}(r) (-1)^l Y_l^m(\theta, \varphi)$$

$$= (-1)^l \psi_{n, l, m}(\vec{r})$$

we have the parity selection rule

$$\langle n, l', m' | H' | n, l, m \rangle$$

$$= +eE \int d^3r' Y_{n l' m'}^*(-\vec{r}') (-z') Y_{n l m}(-\vec{r}')$$

$$= eE \int d^3r' (-1)^{l'} Y_{n l' m'}^*(\vec{r}') (-z') (-1)^l Y_{n l m}(\vec{r}')$$

$$= (-1)^{l+l'+1} \underbrace{eE \int d^3r' Y_{n l' m'}^*(\vec{r}') z' Y_{n l m}(\vec{r}')}_{= \langle n, l', m' | H' | n, l, m \rangle}$$

$$\Rightarrow \langle n, l', m' | H' | n, l, m \rangle [1 - (-1)^{l+l'+1}] = 0$$

Hence we find that

$$\langle n, l', m' | H' | n, l, m \rangle = 0$$

unless $(l+l'+1) = \text{even integer}$.

The parity selection rule.

To be concrete let $n=2$
 then $l, l' = 0, 1$ and the parity
 selection rule implies

$$\langle 2, 1, m' | H' | 2, 1, m \rangle = 0$$

$$\langle 2, 0, 0 | H' | 2, 0, 0 \rangle = 0.$$

For $n=2$, the Stark Effect Hamiltonian
 only connects p-states with s-states

$$\langle 2, 1, m | H' | 2, 0, 0 \rangle$$

$$= e E \int d^3 r \psi_{21m}^*(\vec{r}) z \psi_{200}(\vec{r})$$

Recalling that

$$\psi_{200}(\vec{r}) = R_{20}(r) Y_0^0(\theta, \phi) = R_{20}(r) \frac{1}{\sqrt{4\pi}}$$

$$\psi_{21m}(\vec{r}) = R_{21}(r) Y_1^m(\theta, \phi)$$

$$\text{with } R_{20}(r) = \frac{1}{(2a_0)^{3/2}} \left(2 - \frac{r}{a_0}\right) e^{-r/2a_0}$$

$$R_{21}(r) = \frac{1}{(2a_0)^{3/2}} \frac{1}{\sqrt{3}} \frac{r}{a_0} e^{-r/2a_0}$$

and using

$$z = r \cos \theta = \sqrt{\frac{4\pi}{3}} r Y_1^0(\theta, \varphi)$$

The integral becomes

$$\langle 2, 1, m | H' | 2, 0, 0 \rangle$$

$$= eE \sqrt{\frac{1}{4\pi}} \sqrt{\frac{4\pi}{3}} \int_0^\infty dr r^3 R_{2,1}(r) R_{2,0}(r) \times$$

$$\underbrace{\int d\Omega Y_1^{m*}(\theta, \varphi) Y_1^0(\theta, \varphi)}_{=\delta_{m0}}$$

$$= \frac{eE}{\sqrt{3}} \delta_{m0} \int_0^\infty dr r^3 R_{2,1}(r) R_{2,0}(r)$$

$$= \frac{eE}{3} \delta_{m0} \frac{1}{(2a_0)^3} \frac{1}{a_0} \int_0^\infty dr r^4 \left(2 - \frac{r}{a_0}\right) e^{-\frac{r}{a_0}}$$

$$\text{let } \xi = \frac{r}{a_0}$$

$$= \frac{eE \delta_{m0}}{24 a_0^4} a_0^5 \underbrace{\int_0^\infty d\xi \xi^4 (2 - \xi) e^{-\xi}}$$

$$= 2\Gamma(5) - \Gamma(6) = 2 \cdot (4!) - 5! \\ = -3(4!)$$

$$\langle 2, 1, m | H' | 2, 0, 0 \rangle = -3eEa_0 \delta_{m0}$$

The H' -matrix in the $n=2$ subspace is given by

$$(H')_{\substack{(l', m') \\ \text{rows}}} \substack{(l, m) \\ \text{columns}} = \langle 2, l', m' | H' | 2, l, m \rangle$$

$$= \begin{matrix} (l', m') \backslash (l, m) \\ \begin{matrix} (1, 1) \\ (1, -1) \\ (1, 0) \\ (0, 0) \end{matrix} \end{matrix} \begin{pmatrix} (1, 1) & (1, -1) & (1, 0) & (0, 0) \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -3eEa_0 \\ 0 & 0 & -3eEa_0 & 0 \end{pmatrix}.$$

Thus we find the first order energy shifts by diagonalizing this matrix. The eigenstates to zeroth order are the associated eigenvectors of the matrix.

Clearly there are 2 zero eigenvalues with eigenvectors $|2,1,1\rangle$ and $|2,1,-1\rangle$.

The 2×2 -matrix in the lower right corner has eigenvalues

$$\begin{vmatrix} \lambda & -3eEa_0 \\ -3eEa_0 & \lambda \end{vmatrix} = 0 = \lambda^2 - (3eEa_0)^2$$

$\Rightarrow$

$$\lambda = \pm 3eEa_0$$

Their orthonormal eigenvectors are just the sum and difference of the $|2,1,0\rangle$ and $|2,0,0\rangle$ states

$\frac{1}{\sqrt{2}}(|2,1,0\rangle + |2,0,0\rangle)$ has eigenvalue $-3eEa_0$

$\frac{1}{\sqrt{2}}(|2,1,0\rangle - |2,0,0\rangle)$ has eigenvalue $+3eEa_0$

i.e. $\begin{pmatrix} 0 & -3eEa_0 \\ -3eEa_0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \end{pmatrix} = -3eEa_0 \begin{pmatrix} 1 \\ 1 \end{pmatrix}$

$$\begin{pmatrix} 0 & -3eEa_0 \\ -3eEa_0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ -1 \end{pmatrix} = +3eEa_0 \begin{pmatrix} 1 \\ -1 \end{pmatrix}$$

ie. in R-S degenerate perturbation theory
notational

$$|4_2^{(0)}\rangle = 4_{21}|2,1,0\rangle + 4_{22}|2,0,0\rangle$$

$$\begin{pmatrix} 4_{21} \\ 4_{22} \end{pmatrix} = \begin{cases} (1) \frac{1}{\sqrt{2}} \\ (-1) \frac{1}{\sqrt{2}} \end{cases} \quad \text{above.}$$

Hence to summarize:

Eigenstates	Energy Shift ΔE	Energy $E_2^0 + \Delta E$
$ 2,1,1\rangle$	0	$E_2^0 = -\frac{mc^2\alpha^2}{8}$
$ 2,1,-1\rangle$	0	$E_2^0 = -\frac{mc^2\alpha^2}{8}$
$\frac{1}{\sqrt{2}}(2,1,0\rangle + 2,0,0\rangle)$	$-3eEa_0$	$E_2^0 - 3eEa_0$
$\frac{1}{\sqrt{2}}(2,1,0\rangle - 2,0,0\rangle)$	$+3eEa_0$	$E_2^0 + 3eEa_0$

The $|2,1,\pm 1\rangle$ states remain degenerate in energy while the remaining $n=2$ energy shifts are linear in E .

Stark Diagram in first order

Note that the shifted eigenstates have an electric dipole moment

$$d_{\pm} = \frac{1}{\sqrt{2}} (\langle 2,1,0 | \pm \langle 2,0,0 | [-eZ] \times (| 2,1,0 \rangle \pm | 2,0,0 \rangle)$$

$$= \mp \frac{e}{2} (\langle 2,1,0 | Z | 2,0,0 \rangle + \langle 2,0,0 | Z | 2,1,0 \rangle)$$

$$d_{\pm} = \mp e \underbrace{\langle 2,1,0 | z | 2,0,0 \rangle}_{=-3a_0}$$

$$d_{\pm} = \pm 3ea_0$$

The hydrogen atom has a permanent electric dipole moment. The Stark effect energy shifts are just the effects of this electric dipole moment in an external electric field

$$\Delta E = -d_{\pm} E = \mp 3eEa_0.$$
